## **Edexcel and BTEC Qualifications**

Edexcel and BTEC qualifications are awarded by Pearson, the UK's largest awarding body. We provide a wide range of qualifications including academic, vocational, occupational and specific programmes for employers. For further information visit our qualifications websites at [www.edexcel.com](http://www.edexcel.com) or [www.btec.co.uk](http://www.btec.co.uk). Alternatively, you can get in touch with us using the details on our contact us page at [www.edexcel.com/contactus](http://www.edexcel.com/contactus).

## **Pearson: helping people progress, everywhere**

Pearson aspires to be the world's leading learning company. Our aim is to help everyone progress in their lives through education. We believe in every kind of learning, for all kinds of people, wherever they are in the world. We've been involved in education for over 150 years, and by working across 70 countries, in 100 languages, we have built an international reputation for our commitment to high standards and raising achievement through innovation in education. Find out more about how we can help you and your students at: [www.pearson.com/uk](http://www.pearson.com/uk)

## General Marking Guidance

- All candidates must receive the same treatment. Examiners must mark the first candidate in exactly the same way as they mark the last.
- Mark schemes should be applied positively. Candidates must be rewarded for what they have shown they can do rather than penalised for omissions.
- Examiners should mark according to the mark scheme not according to their perception of where the grade boundaries may lie.
- There is no ceiling on achievement. All marks on the mark scheme should be used appropriately.
- All the marks on the mark scheme are designed to be awarded. Examiners should always award full marks if deserved, i.e. if the answer matches the mark scheme. Examiners should also be prepared to award zero marks if the candidate's response is not worthy of credit according to the mark scheme.
- Where some judgement is required, mark schemes will provide the principles by which marks will be awarded and exemplification may be limited.
- When examiners are in doubt regarding the application of the mark scheme to a candidate's response, the team leader must be consulted.
- Crossed out work should be marked UNLESS the candidate has replaced it with an alternative response.

## EDEXCEL GCE MATHEMATICS

### General Instructions for Marking

1. The total number of marks for the paper is 75.
2. The Edexcel Mathematics mark schemes use the following types of marks:
  - **M** marks: method marks are awarded for 'knowing a method and attempting to apply it', unless otherwise indicated.
  - **A** marks: Accuracy marks can only be awarded if the relevant method (M) marks have been earned.
  - **B** marks are unconditional accuracy marks (independent of M marks)
  - Marks should not be subdivided.
3. Abbreviations

These are some of the traditional marking abbreviations that will appear in the mark schemes.

- bod – benefit of doubt
  - ft – follow through
  - the symbol  $\checkmark$  will be used for correct ft
  - cao – correct answer only
  - cso - correct solution only. There must be no errors in this part of the question to obtain this mark
  - isw – ignore subsequent working
  - awrt – answers which round to
  - SC: special case
  - oe – or equivalent (and appropriate)
  - dep – dependent
  - indep – independent
  - dp decimal places
  - sf significant figures
  - \* The answer is printed on the paper
  - The second mark is dependent on gaining the first mark
4. For misreading which does not alter the character of a question or materially simplify it, deduct two from any A or B marks gained, in that part of the question affected.
  5. Where a candidate has made multiple responses and indicates which response they wish to submit, examiners should mark this response.

If there are several attempts at a question which have not been crossed out, examiners should mark the final answer which is the answer that is the most complete.

6. Ignore wrong working or incorrect statements following a correct answer.
7. Mark schemes will firstly show the solution judged to be the most common response expected from candidates. Where appropriate, alternative answers are provided in the notes. If examiners are not sure if an answer is acceptable, they will check the mark scheme to see if an alternative answer is given for the method used.

		<b>(4)</b>	
<b>(8 marks)</b>			
Notes:			
<b>Mark (i) and (ii) together</b>			
<b>(a)(i)</b>			
<b>B1:</b> Defines 3 variables, minimum e.g. construction = $C$ , Design = $D$ , Hospitality = $H$ . This may be seen in text of the question, abbreviations may be used			
<b>(ii)</b>			

**M1:** Finds either the increase or the number of students in 2020. This may be implied by any equation which equals 1113 or 1112.997. If students use 1100 instead of 1110 this is slip and we can award this mark.

**M1:** Attempts to use the model to set up at least 2 equations

**A1:** All 3 simplified equations correct (decimals or fractions), one for each different piece of information. Award with mark even if B0 is scored and it is clear what the variables used stand for. Ignore any additional equations even if incorrect. As soon as 3 correct equations are seen you may award this mark.

**Alternative approach**

(i) **B1:** Construction =  $H + 370$ , Design =  $D$ , Hospitality =  $H$

(ii) **M1M1A1:**  $H + 370 + D + H = 1110$  o.e  $C = H + 370$   $1.0125(H + 370) + 1.025D + 0.98H = 1113$  or  $1112.997$  o.e. they do not need to be simplified

**(b) This is M1 M1 A1 A1 on ePen but is marked M1A1M1A1**

**M1:** Uses their equation in part(a) to set up a matrix equation of the form  $\begin{pmatrix} \dots & \dots & \dots \\ \dots & \dots & \dots \\ \dots & \dots & \dots \end{pmatrix} \begin{pmatrix} C \\ D \\ H \end{pmatrix} = \begin{pmatrix} \dots \\ \dots \\ \dots \end{pmatrix}$ , where “...” are numerical values.

**A1ft:** Correct matrix equation for their equations

**dm1:** Dependent on previous method mark. Writes  $\left( \text{their } A \right)^{-1} \begin{pmatrix} 1110 \\ \text{their "370"} \\ \text{their "3"} \end{pmatrix}$  and obtains at

least one value of  $C, D$  or  $H$ . The inverse matrix need not be found, writing  $A^{-1} \begin{pmatrix} 1110 \\ 370 \\ \text{their "3"} \end{pmatrix} = \dots$  is sufficient. A correct matrix equation followed by correct values implies this mark.

Condone  $\begin{pmatrix} 1110 \\ \text{their "370"} \\ \text{their "3"} \end{pmatrix} A^{-1} = \dots$  as long as they reach some values. The values imply the correct method

**Note:**  $\begin{pmatrix} 1 & 1 & 1 \\ 1 & 0 & -1 \\ 0.0125 & 0.025 & -0.02 \end{pmatrix}^{-1} = \begin{pmatrix} \frac{10}{23} = 0.43\dots & \frac{18}{23} = 0.78\dots & -\frac{400}{23} = -17.39\dots \\ \frac{3}{23} = 0.13\dots & -\frac{13}{23} = -0.56\dots & \frac{800}{23} = 34.78\dots \\ \frac{10}{23} = 0.43\dots & -\frac{5}{23} = -0.21\dots & -\frac{400}{23} = -17.39\dots \end{pmatrix}$

$$\begin{pmatrix} 1 & 1 & 1 \\ 1 & 0 & -1 \\ 1.0125 & 1.025 & 0.98 \end{pmatrix}^{-1} = \begin{pmatrix} \frac{410}{23} = 17.82\dots & \frac{18}{23} = 0.78\dots & -\frac{400}{23} = -17.39\dots \\ -\frac{797}{23} = -34.65\dots & \frac{13}{23} = -0.56\dots & \frac{800}{23} = 34.78\dots \\ \frac{410}{23} = 17.82\dots & -\frac{5}{23} = -0.21\dots & -\frac{400}{23} = -17.39\dots \end{pmatrix}$$

**A1:** Interprets the answer in the context of the question, minimum is  $C = 720, D = 40, H = 350$  with their variables. Condone the variable not been defined for this mark if it is clear which variable belong to what course.

**Note:** they must be using a matrix equation to solve the equation to score any marks.

**Alternative approach**

For example

Equations simplifies to  $C - H = 370$ ,  $D + 2H = 740$  and  $1.025D + 1.9925H = 738.375$

$$\text{which leads to } \begin{pmatrix} 0 & 1 & 2 \\ 1 & 0 & -1 \\ 0 & 1.025 & 1.9925 \end{pmatrix} \begin{pmatrix} C \\ D \\ H \end{pmatrix} = \begin{pmatrix} 740 \\ 370 \\ 738.375 \end{pmatrix} \text{ then } \begin{pmatrix} C \\ D \\ H \end{pmatrix} =$$
$$\begin{pmatrix} 17.826 & 1 & -17.3913 \\ -34.6521 & 0 & 34.7826 \\ 17.826 & 0 & -17.3913 \end{pmatrix} \begin{pmatrix} 740 \\ 370 \\ 738.375 \end{pmatrix} = \begin{pmatrix} 720 \\ 40 \\ 350 \end{pmatrix}$$

**Note:** A 2 x 2 matrix is fine if it is appropriate for their equation.

**Special Case:** Forming an equation in one variable

**(a)(i) B1:** Hospitality =  $x$ , Construction =  $x + 370$ , Design =  $740 - 2x$

**(ii) M1M1A1:**  $1.0125(x + 370) + 1.025(740 - 2x) + 0.98x = 1113$  or 1112.997

**(a)(i) B1:** Hospitality =  $x - 370$ , Construction =  $x$ , Design =  $1480 - 2x$

**(ii) M1M1A1:**  $1.0125(x) + 1.025(1480 - 2x) + 0.98(x - 370) = 1113$  or 1112.997

**(b) M0A0M0A0:** They have an equation and are not forming and solving a matrix equation

**(11 marks)**

Notes:

**(a)**

**B1:** Shows that the result holds for  $n = 1$ . Must see substitution in the RHS minimum required

is  $\begin{pmatrix} 3 & \frac{a}{2}(3-1) \\ 0 & 1 \end{pmatrix}$  and reaches  $\begin{pmatrix} 3 & a \\ 0 & 1 \end{pmatrix}$

**M1:** Assumes the result is true for some value of  $n = k$ . Assume (true for)  $n = k$  is sufficient.

Alternatively states assume  $\mathbf{M}^n$  or  $\begin{pmatrix} 3 & a \\ 0 & 1 \end{pmatrix}^k = \begin{pmatrix} 3^k & \frac{a}{2}(3^k-1) \\ 0 & 1 \end{pmatrix}$

**M1:** Sets up a matrix multiplication of their assumed result multiplied by the original matrix, either way round. Allow a slip as long as the intention is clear.

**A1:** Achieves a correct un-simplified matrix

**A1:** Reaches a correct simplified matrix with **no errors, the correct un-simplified matrix seen previously and at least one intermediate line which must be correct.**

**A1:** Correct conclusion. This mark is dependent on all previous marks except B mark but  $n = 1$  must have been attempted. It is gained by conveying the ideas of **all four bold points** either at the end of their solution or as a narrative in their solution. Condone  $n \in \mathbb{Z}$

**(b)(i)**

**B1:** States correct determinant. This can be implied by a correct equation

**M1:** Correct method to find a value of  $n$  using  $5 \times$  'their  $\det(\mathbf{M}^n) = 1215$ ' which involves solving an index equation of the form  $p^n = q$  where  $n > 1$

**A1:**  $n = 5$

**(ii)**

**M1:** Sets up an equation by multiplying the matrix  $\mathbf{M}^n$  by  $\begin{pmatrix} 2 \\ -2 \end{pmatrix}$  setting equal to  $\begin{pmatrix} 123 \\ -2 \end{pmatrix}$  and reaches a value for  $a$ . You may just see  $2(3^n) - 2\frac{a}{2}(3^n-1) = 123 \Rightarrow a = \dots$

Follow through on their value for  $n$ .

**A1:**  $a = 1.5$

**dM1:** Solve a quadratic equation for  $a$ , by squaring and solving an equation of the form  $a^2 = K$  where  $K > 0$

**A1:** Deduces the correct value of  $a$  from a correct equation. Must be seen in part (a) using the angle between the lines.

**Alternative cross product method**

$$\mathbf{M1:} \begin{vmatrix} 2 & a & 0 \\ 0 & 1 & -1 \end{vmatrix} = \sqrt{2^2 + a^2} \sqrt{1^2 + (-1)^2} \sin 120$$

$$\mathbf{A1:} \sqrt{a^2 + 8} = \sqrt{4 + a^2} \sqrt{2} \frac{\sqrt{3}}{2}$$

Then as above

**Note If they use the point of intersection to find a value for  $a$  this scores no marks**

**(b)**

**M1:** Uses the model to write down any two correct equations

**M1:** Solve two equations simultaneously to find a value for  $\mu$  and  $\lambda$

**dM1:** Dependent on previous method mark. Substitutes  $\mu$  and  $\lambda$  into a relevant equation. If no method shown two correct ordinates implies this mark.

**A1:** Correct coordinates. May be seen in part (c)

**B1:** Shows that the values of  $\mu$  and  $\lambda$  give the same third coordinate or point of intersection and draws the conclusion that the **lines intersect/common point/consistent** or tick.

**Note:** If an incorrect value for  $a$  is found in part (a) but in part (b) they find that  $a = -2$  this scores **B0** but all other marks are available

**(c) This is M1M1A1 on ePen marking as M1 A1ft A1**

**M1:** Full attempt to find the minimum distance from a point to a plane. Condone a sign slip with the value of  $d$ .

**A1ft:** Following through on their point of intersection. Uses the model to find a correct expression for minimum distance from the nest to the ground

**A1:** Correct distance

**Alternative**

**M1:** Find the shortest distance from a point to plane by finding the perpendicular distance from the given plane to the origin and the perpendicular distance from the plane contacting their point of intersection to the origin and subtracts

**A1ft:** Following through on their point of intersection. Uses the model to find a correct expression for minimum distance from the nest to the ground

**A1:** Correct distance

**(d)**

**B1:** Comments on one of the models

- Flight path of the birds modelled as a straight line
- Angle between flight paths modelled as  $120^\circ$
- The bird's nest is modelled as a point
- Ground modelled as a plane

Then states unreliabl
