<b>Friday 14 June 2019</b>			
Afternoon		Paper Reference <b>9MA0-32</b>	
<b>Mathematics</b> <b>Advanced</b> <b>Paper 32: Mechanics</b>			
<b>You must have:</b> Mathematical Formulae and Statistical Tables, calculator			Total Marks

**Candidates may use any calculator allowed by Pearson regulations. Calculators must not have the facility for symbolic algebra manipulation, differentiation and integration, or have retrievable mathematical formulae stored in them.**

### Instructions

- Use **black** ink or ball-point pen.
- If pencil is used for diagrams/sketches/graphs it must be dark (HB or B).
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions and ensure that your answers to parts of questions are clearly labelled.
- Answer the questions in the spaces provided  
– *there may be more space than you need.*
- You should show sufficient working to make your methods clear.  
Answers without working may not gain full credit.
- Answers should be given to three significant figures unless otherwise stated.

### Information

- A booklet 'Mathematical Formulae and Statistical Tables' is provided.
- The total mark for this part of the examination is 50. There are 5 questions.
- The marks for **each** question are shown in brackets  
– *use this as a guide as to how much time to spend on each question.*
- Unless otherwise stated, whenever a value of  $g$  is required, take  $g = 9.8 \text{ m s}^{-2}$  and give your answer to either 2 significant figures or 3 significant figures.

### Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.

Pearson

Answer ALL questions. Write your answers in the spaces provided.

1. [In this question position vectors are given relative to a fixed origin  $O$ ]

At time  $t$  seconds, where  $t \geq 0$ , a particle,  $P$ , moves so that its velocity  $\mathbf{v}$   $\text{m s}^{-1}$  is given by

$$\mathbf{v} = 6t\mathbf{i} - 5t^{\frac{3}{2}}\mathbf{j}$$

When  $t = 0$ , the position vector of  $P$  is  $(-20\mathbf{i} + 20\mathbf{j})\text{m}$ .

(a) Find the acceleration of  $P$  when  $t = 4$

(3)

(b) Find the position vector of  $P$  when  $t = 4$

(3)

$$a/ \quad \frac{d\mathbf{v}}{dt} = 6\mathbf{i} - \frac{15}{2}t^{\frac{1}{2}}\mathbf{j} \quad \left[ a = \frac{d\mathbf{v}}{dt} \right]$$

when  $t = 4$

$$\begin{aligned} \frac{d\mathbf{v}}{dt} &= 6\mathbf{i} - \frac{15}{2}(4)^{\frac{1}{2}}\mathbf{j} \\ &= \underline{\underline{6\mathbf{i} - 15\mathbf{j}}} \quad \text{ms}^{-2} \end{aligned}$$

$$\begin{aligned} b/ \quad \mathbf{s} &= \frac{6t^2}{2}\mathbf{i} - \frac{5t^{\frac{5}{2}}}{\frac{5}{2}}\mathbf{j} + \mathbf{c} \\ &= 3t^2\mathbf{i} - 2t^{\frac{5}{2}}\mathbf{j} + \mathbf{c} \end{aligned}$$

when  $t = 0$   $\mathbf{s} = -20\mathbf{i} + 20\mathbf{j}$

$$\mathbf{s} = 3t^2\mathbf{i} - 2t^{\frac{5}{2}}\mathbf{j} - 20\mathbf{i} + 20\mathbf{j}$$

when  $t = 4$

$$\begin{aligned} \mathbf{s} &= 3(4)^2\mathbf{i} - 2(4)^{\frac{5}{2}}\mathbf{j} - 20\mathbf{i} + 20\mathbf{j} \\ &= \underline{\underline{28\mathbf{i} - 44\mathbf{j}}} \quad \text{m} \end{aligned}$$

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

2. A particle,  $P$ , moves with constant acceleration  $(2\mathbf{i} - 3\mathbf{j})\text{ms}^{-2}$

At time  $t = 0$ , the particle is at the point  $A$  and is moving with velocity  $(-\mathbf{i} + 4\mathbf{j})\text{ms}^{-1}$

At time  $t = T$  seconds,  $P$  is moving in the direction of vector  $(3\mathbf{i} - 4\mathbf{j})$

(a) Find the value of  $T$ .

(4)

At time  $t = 4$  seconds,  $P$  is at the point  $B$ .

(b) Find the distance  $AB$ .

(4)

$$a) \quad v = u + at$$

$$k(3\mathbf{i} - 4\mathbf{j}) = -\mathbf{i} + 4\mathbf{j} + T(2\mathbf{i} - 3\mathbf{j})$$

$$3k\mathbf{i} - 4k\mathbf{j} = -\mathbf{i} + 4\mathbf{j} + 2T\mathbf{i} - 3T\mathbf{j}$$

$$\cancel{i} \quad 3k = -1 + 2T$$

$$\cancel{j} \quad -4k = 4 - 3T$$

$$k = \frac{-1 + 2T}{3}$$

$$k = \frac{4 - 3T}{-4}$$

$$\frac{-1 + 2T}{3} = \frac{4 - 3T}{-4}$$

$$-4(-1 + 2T) = 3(4 - 3T)$$

$$4 - 8T = 12 - 9T$$

$$\underline{\underline{T = 8}}$$

$$b) \quad s = ut + \frac{1}{2}at^2$$

$$= 4(-\mathbf{i} + 4\mathbf{j}) + \frac{1}{2}(2\mathbf{i} - 3\mathbf{j})(4)^2$$

$$= -4\mathbf{i} + 16\mathbf{j} + 8(2\mathbf{i} - 3\mathbf{j})$$

$$= -4\mathbf{i} + 16\mathbf{j} + 16\mathbf{i} - 24\mathbf{j}$$

Question 2 continued

$$s = 12i - 8j$$

$$\text{distance} = \sqrt{12^2 + 8^2}$$

$$= \underline{\underline{14.4 \text{ m}}} \quad (3 \text{ s.f.})$$

(Total for Question 2 is 8 marks)

3.

Figure 1

Two blocks,  $A$  and  $B$ , of masses  $2m$  and  $3m$  respectively, are attached to the ends of a light string.

Initially  $A$  is held at rest on a fixed rough plane.

The plane is inclined at angle  $\alpha$  to the horizontal ground, where  $\tan \alpha = \frac{5}{12}$

The string passes over a small smooth pulley,  $P$ , fixed at the top of the plane.

The part of the string from  $A$  to  $P$  is parallel to a line of greatest slope of the plane. Block  $B$  hangs freely below  $P$ , as shown in Figure 1.

The coefficient of friction between  $A$  and the plane is  $\frac{2}{3}$

The blocks are released from rest with the string taut and  $A$  moves up the plane.

The tension in the string immediately after the blocks are released is  $T$ .

The blocks are modelled as particles and the string is modelled as being inextensible.

(a) Show that  $T = \frac{12mg}{5}$  (8)

After  $B$  reaches the ground,  $A$  continues to move up the plane until it comes to rest before reaching  $P$ .

(b) Determine whether  $A$  will remain at rest, carefully justifying your answer. (2)

(c) Suggest two refinements to the model that would make it more realistic. (2)

$$\tan \alpha = \frac{5}{12} = \frac{O}{A}$$

$$\sqrt{5^2 + 12^2} = 13$$

$$\sin \alpha = \frac{O}{H} = \frac{5}{13} \quad \cos \alpha = \frac{A}{H} = \frac{12}{13}$$

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

Question 3 continued

A: perp to plane

$$R = 2mg \cos \alpha$$

$$= \frac{24}{13} mg$$

$$F = ma$$

$$T - 2mg \sin \alpha - \mu R = 2ma$$

$$T - 2mg \frac{5}{13} - \frac{2}{3} \cdot \frac{24}{13} mg = 2ma$$

$$T - 2mg = 2ma$$

B:  $F = ma$

$$3mg - T = 3ma$$

$$A: a = \frac{T - 2mg}{2m}$$

$$B: a = \frac{3mg - T}{3m}$$

$$\frac{T - 2mg}{2} = \frac{3mg - T}{3}$$

$$3T - 6mg = 6mg - 2T$$

$$5T = 12mg$$

$$T = \frac{12mg}{5}$$

Question 3 continued

$$\begin{aligned} b) \quad F_{\max} &= \frac{2}{3} \cdot \frac{24}{13} mg \\ &= \frac{16}{13} mg \end{aligned}$$

$$\begin{aligned} \text{Force down plane} &= 2mg \sin \alpha \\ &= 2mg \left( \frac{5}{13} \right) \\ &= \frac{10}{13} mg \end{aligned}$$

$F_{\max} > \frac{10}{13} mg$ , it will remain at rest

- c/
- the weight of the string
  - the pulley could be rough

[ the blocks could not be particles ]  
[ the string could be extensible ]

4.

Figure 2

A ramp,  $AB$ , of length 8 m and mass 20 kg, rests in equilibrium with the end  $A$  on rough horizontal ground.

The ramp rests on a smooth solid cylindrical drum which is partly under the ground. The drum is fixed with its axis at the same horizontal level as  $A$ .

The point of contact between the ramp and the drum is  $C$ , where  $AC = 5$  m, as shown in Figure 2.

The ramp is resting in a vertical plane which is perpendicular to the axis of the drum, at an angle  $\theta$  to the horizontal, where  $\tan \theta = \frac{7}{24}$

The ramp is modelled as a uniform rod.

(a) Explain why the reaction from the drum on the ramp at point  $C$  acts in a direction which is perpendicular to the ramp. (1)

(b) Find the magnitude of the resultant force acting on the ramp at  $A$ . (9)

The ramp is still in equilibrium in the position shown in Figure 2 but the ramp is not now modelled as being uniform.

Given that the centre of mass of the ramp is assumed to be closer to  $A$  than to  $B$ ,

(c) state how this would affect the magnitude of the normal reaction between the ramp and the drum at  $C$ . (1)

a) The drum is smooth  $\therefore$  the reaction is perp. to ramp.

Question 4 continued

b/ Taking moments about A

$$4 \cdot 20g \cos \theta = 5 R_c$$

$$80g \left( \frac{24}{25} \right) = 5 R_c$$

$$\frac{384}{5} g = 5 R_c$$

$$R_c = \frac{384}{25} g \quad N$$

$$= \frac{150.5}{(151 \text{ N } 3 \text{ sf})}$$

$$\leftarrow = \rightarrow \quad R_c \sin \theta = F_n$$

$$\frac{384}{25} g \cdot \frac{7}{25} = F_n$$

$$F_n = \frac{2688}{625} g \quad N = (42.1 \text{ } 3 \text{ sf})$$

$$\uparrow = \downarrow \quad R_A + R_c \cos \theta = 20g$$

$$R_A + \frac{384}{25} g \left( \frac{24}{25} \right) = 20g$$

$$R_A = \frac{3284}{625} g \quad N (51.5 \text{ } 3 \text{ sf})$$

$$\text{Magnitude} = \sqrt{42.1^2 + 51.5^2}$$

$$= \underline{\underline{66.5 \text{ N } 3 \text{ sf}}}$$

c/ ~~The~~ <sup>as d decreases</sup> ~~R<sub>c</sub> decreases~~  $\rightarrow d(20g \cos \theta) = 5 R_c$

The magnitude of the normal reaction will decrease.

5.

Figure 3

The points  $A$  and  $B$  lie 50 m apart on horizontal ground.

At time  $t = 0$  two small balls,  $P$  and  $Q$ , are projected in the vertical plane containing  $AB$ .

Ball  $P$  is projected from  $A$  with speed  $20 \text{ m s}^{-1}$  at  $30^\circ$  to  $AB$ .

Ball  $Q$  is projected from  $B$  with speed  $u \text{ m s}^{-1}$  at angle  $\theta$  to  $BA$ , as shown in Figure 3.

At time  $t = 2$  seconds,  $P$  and  $Q$  collide.

Until they collide, the balls are modelled as particles moving freely under gravity.

- (a) Find the velocity of  $P$  at the instant before it collides with  $Q$ . (6)
- (b) Find
- (i) the size of angle  $\theta$ ,
  - (ii) the value of  $u$ . (6)
- (c) State one limitation of the model, other than air resistance, that could affect the accuracy of your answers. (1)

a) Horizontally  $u = 20 \cos 30$   
 $t = 2$   
 $a = 0$

$$v = 20 \cos 30$$

Vertically  $u = 20 \sin 30$   
 $a = -9.8$   
 $t = 2$

$$v = 20 \sin 30 + (-9.8)(2)$$

$$= 20 \sin 30 - 19.6$$

Question 5 continued

$$\text{magnitude} = \sqrt{(10\sqrt{3})^2 + 9.6^2}$$

$$= 19.8 \text{ ms}^{-1}$$

$$\tan \theta = \frac{9.6}{10\sqrt{3}}$$

$$\theta = \tan^{-1} \left( \frac{9.6}{10\sqrt{3}} \right)$$

$$= 29.0^\circ$$

$19.8 \text{ ms}^{-1}$  at an angle of  $29^\circ$  to the horizontal

b) At  $t = 2$

P// & Horizontally

$$s = ut$$

$$= 20 \cos 30 \times 2$$

$$= 20\sqrt{3} \text{ m}$$

Vertically  $s = (20 \sin 30)(2) + \frac{1}{2}(-9.8)(2)^2$

$$= 0.4 \text{ m}$$

B' Q// Horizontal distance =  $50 - 20\sqrt{3}$   
Vertical distance =  $0.4$

Horizontally:  $u = u \cos \theta$

$$t = 2$$

$$s = ut$$

$$50 - 20\sqrt{3} = u \cos \theta (2)$$

$$25 - 10\sqrt{3} = u \cos \theta$$

Question 5 continued

vertically:

$$s = 0.4$$

$$u = u \sin \theta$$

$$v$$

$$a = -9.8$$

$$t = 2$$

$$s = ut + \frac{1}{2} at^2$$

$$0.4 = 2u \sin \theta + \frac{1}{2} (-9.8) (2)^2$$

$$0.4 = 2u \sin \theta - 19.6$$

$$20 = 2u \sin \theta$$

$$10 = u \sin \theta$$

From horizontal:  $25 - 10\sqrt{3} = u \cos \theta$

$$\frac{10}{25 - 10\sqrt{3}} = \frac{u \sin \theta}{u \cos \theta}$$

$$\frac{10}{25 - 10\sqrt{3}} = \tan \theta$$

$$\theta = \underline{\underline{52.5^\circ}}$$

$$10 = u \sin 52.5$$

$$u = \frac{10}{\sin 52.5}$$

$$= \underline{\underline{12.6 \text{ ms}^{-1}}}$$

c/  $g$  is not exactly  $9.8 \text{ ms}^{-2}$

[or the balls are not particles]
